

Strategy Description

Consumer algorithm for external RL signals. Polls a public JSON endpoint (Gist) with PPO signals for UNH, TSLA, TMO, applies a staleness guard, sizes by confidence, and places trades on an hourly resolution. How it works - Signal source: Public RAW Gist URL that serves live\_signals.json from an off-platform Colab "producer". - Freshness guard: Ignores payloads when UtcTime > valid\_until\_utc (epoch-safe check). -Universe/data: UNH, TSLA, TMO at Resolution.Hour (configurable). - Execution & amp; sizing: BUY/HOLD/SELL mapping; target = clamp(confidence, 0.10-0.50). SELL → Liquidate; HOLD → no action. - Models in QC: None-SB3/torch run off-platform; QC just consumes JSON. Parameters (Project → Parameters) - Mode: json-live | json-ignore-time - SignalsUrl: RAW Gist URL (required) - Symbols: e.g. UNH,TSLA,TMO - PollingMinutes: e.g., '60'

Key Statistics

Runtime Days	365	Drawdown	26.9%
Turnover	1%	Probabilistic SR	43%
CAGR	35.9%	Sharpe Ratio	0.8
Capacity (USD)	210M	Sortino Ratio	1.1
Trades per Day	2.3	Information Ratio	0.5
